

Capstone Project Documentation

Title: Healthcare & Wellness Management System

Healthcare and wellness services often rely on manual record-keeping and fragmented systems, which lead to delays in patient care, lack of proper tracking of medical history, and limited interaction between patients and providers. The goal is to build a Healthcare & Wellness Management System that allows patients to book appointments, track health records, and access wellness services, while administrators and healthcare providers can manage patient records, appointments, and reports.

Roles;

1. Admin
2. Provider/Doctor
3. Patient

“This is a healthcare management platform where patients can register and enroll in wellness programs, doctors/providers can manage services, and admins have full access to oversee users, track enrollments, and manage wellness programs with real-time statistics.”

Step1, this is the Healthcare&Wellness dashboard.

Step2, This is the Registration page of Patient.

Wellness Program Dashboard , where we can the programmes with the respective data .

Patient Dashboard- Contains Details, Booking an appointment , piechart status of booking.

Booking Appointment Data required and status of Booking.

The screenshot displays the 'Book Appointment' and 'My Appointments' sections. The 'Book Appointment' section includes a 'Select Provider' dropdown menu (currently showing 'Select'), a 'Date & Time' input field (showing 'dd-mm-yyyy'), and a 'Reason' text area. A blue 'Book Appointment' button is located below these fields. The 'My Appointments' section contains a table with the following data:

ID	Provider	Date & Time	Notes	Status
1	karunakar	2025-09-02T10:25:00	hair loss	CONFIRMED
2	je	2025-09-08T25:00:00	leg pain	CONFIRMED

Patient can also enroll to the Wellness Services .

Provider/Doctor DashBoard, They have the access to approve and deny the appointment. Here, Provider already approved the appointment.

[illegible]

The screenshot shows a VS Code editor with a project named 'healthcare-frontend'. The file explorer on the left shows the project structure, including 'src' and 'pages' folders. The main editor displays the 'AdminDashboard.js' file, which contains a React component for managing services. The component uses the 'useState' hook to manage a list of services and a 'handleClick' function to toggle the 'active' status of a service. The component is rendered as a table with columns for 'id', 'name', 'description', 'duration', 'fee', and 'actions'. The bottom status bar indicates 'Compiled successfully!'. On the right, a Copilot sidebar is visible with a 'Welcome to Copilot' message and a 'Let's get started' button.

Swagger Screenshot,
